## HIV INTEGRASE INHIBITORS

### FIELD OF THE INVENTION

5

The present invention is generally directed to antiviral compounds, and more specifically directed to compounds which can inhibit the functioning of the human immunodeficiency virus-1 (HIV-1), compositions comprising such compounds and methods for inhibiting the functioning of the HIV-1.

10

### BACKGROUND OF THE INVENTION

HIV-1 infection remains a major medical problem, with an estimated 42 million people infected worldwide at the end of 2002. The number of cases of HIV and AIDS (acquired immunodeficiency syndrome) has risen rapidly. In 2002, ~5.0 million new infections were reported, and 3.1 million people died from AIDS. Currently available drugs for the treatment of HIV include, for example, the following nucleoside reverse transcriptase (RT) inhibitors: Retrovir<sup>™</sup> zidovudine (or AZT), Videx<sup>™</sup> didanosine, Zerit<sup>™</sup> stavudine, Epivir<sup>™</sup> lamivudine (or 3TC), Hivid<sup>™</sup> zalcitabine (or DDC), Ziagen<sup>™</sup> abacavir succinate, Viread<sup>™</sup> Tenofovir disoproxil fumarate salt, Combivir<sup>™</sup> (-3TC plus AZT), Trizivir<sup>™</sup> (abacavir, lamivudine, and zidovudine); the following non-nucleoside reverse transcriptase inhibitors: Viramune<sup>™</sup> nevirapine, Rescriptor<sup>™</sup> delavirdine and Sustiva<sup>™</sup> efavirenz, and the following peptidomimetic protease inhibitors: saquinavir, indinavir, ritonavir, nelfinavir, amprenavir, lopinavir, Kaletra<sup>™</sup> (lopinavir and rtonavir), and Reyataz<sup>™</sup> atazanavir sulfate. Often, these drugs can only transiently restrain viral replication if used alone. However, when used in combination, these drugs can have a profound effect on viremia and disease progression. In fact, significant reductions in death rates among AIDS patients have been recently documented as a consequence of the widespread application of combination therapy. However, despite these impressive results, 30 to 50% of patients ultimately fail combination drug therapies. Insufficient drug potency, non-compliance, restricted tissue penetration and drug-specific

limitations within certain cell types (e.g. most nucleoside analogs cannot be phosphorylated in resting cells) may account for the incomplete suppression of sensitive viruses. Furthermore, the high replication rate and rapid turnover of HIV-1 combined with the frequent incorporation of mutations, leads to the appearance of drug-resistant variants and treatment failures when sub-optimal drug concentrations are present. Therefore, novel anti-HIV agents exhibiting distinct resistance patterns, and favorable pharmacokinetic as well as safety profiles are needed to provide more treatment options whether used alone or in combination with other drugs.

HIV expresses three enzymes, reverse transcriptase, an aspartyl protease and integrase, all of which are potential antiviral targets for the development of drugs for the treatment of AIDS. However, integrase stands out as being the only viral enzyme not targeted by currently approved therapy. The integrase enzyme is responsible for insertion of the viral cDNA into the host cell genome, which is a critical step in the viral life cycle. There are a number of discrete steps involved in this process including processing of the viral cDNA by removal of two bases from each 3'-terminus and joining of the recessed ends to the host DNA. Studies have shown that in the absence of a functional integrase enzyme HIV is not infectious. Therefore, an inhibitor of integrase would be useful as a therapy for AIDS and HIV infection.

A number of HIV integrase inhibitors have been reported. These include nucleotide-based inhibitors, known DNA binders, catechols and hydrazide containing derivatives (Neamati, N.; Sunder, S.; Pommier, Y., *Drug Disc. Today*, 1997, 2, 487).

Certain pyrimidines and pyrimidinones have been disclosed. WO 02/06246 discloses 2-aryl-4,5-dihydroxy-6-carboxypyrimidines as viral polymerase inhibitors which are proposed for use in treating hepatitis C virus infection. Sunderland, C. J.; Botta, M.; Aime, S.; and Raymond, K. N. *Inorg. Chem.* (2001) 40, 6746-6756 discloses the synthesis of 6-carboxamido-5,4-hydroxypyrimidinones as gadolinium chelating agents.

30 nucleoside reverse transcriptase or HIV entry.

### DETAILED DESCRIPTION OF THE INVENTION

Stereochemical definitions and conventions used herein generally follow McGraw-Hill Dictionary of Chemical Terms, S. P. Parker, Ed., McGraw-Hill Book Company, New York (1984) and Stereochemistry of Organic Compounds, Eliel, E. and Wilen, S., John Wiley & Sons, Inc., New York (1994). Many organic compounds exist in optically active forms, i.e., they have the ability to rotate the plane of plane-polarized light. In describing an optically active compound, the prefixes D and L or R and S are used to denote the absolute configuration of the molecule about its chiral center(s). The prefixes d and l or (+) and (-) are employed to designate the sign of rotation of plane-polarized light by the compound, with (-) or l meaning that the compound is levorotatory and (+) or d, meaning the compound, is dextrorotatory. For a given chemical structure, these compounds, called stereoisomers, are identical except that they are mirror images of one another. A specific stereoisomer of a mirror image pair may also be referred to as an enantiomer, and a mixture of such isomers is often called an enantiomeric mixture. With reference to the instances where (R) or (S) is used, it is to designate the absolute configuration of a substituent in context to the whole compound and not in context to the substituent alone.

20

Unless otherwise specifically noted herein, the terms set forth below will have the following definitions.

The terms "racemic mixture" and "racemate" refer to an equimolar mixture of two enantiomeric species, devoid of optical activity.

25

The term "chiral" refers to molecules which have the property of non-superimposability of the mirror image partner, while the term "achiral" refers to molecules which are superimposable on their mirror image partner.

30

The term "stereoisomers" refers to compounds which have identical chemical composition, but differ with regard to the arrangement of the atoms or groups in space.

5       The term "diastereomer" refers to a stereoisomer which is not an enantiomer, e.g., a stereoisomer with two or more centers of chirality and whose molecules are not mirror images of one another. Diastereomers have different physical properties, e.g. melting points, boiling points, spectral properties, and reactivities. Mixtures of diastereomers may separate under high resolution analytical procedures such as  
10   electrophoresis and chromatography.

The term "enantiomers" refers to two stereoisomers of a compound which are non-superimposable mirror images of one another.

15       The term "pharmaceutically acceptable salt" is intended to include nontoxic salts synthesized from a compound which contains a basic or acidic moiety by conventional chemical methods. Generally, such salts can be prepared by reacting the free acid or base forms of these compounds with a stoichiometric amount of the appropriate base or acid in water or in an organic solvent, or in a mixture of the two;  
20   generally, nonaqueous media like ether, ethyl acetate, ethanol, isopropanol, or acetonitrile are preferred. Lists of suitable salts are found in *Remington's Pharmaceutical Sciences*, 18th ed., Mack Publishing Company, Easton, PA, 1990, p. 1445. The compounds of the present invention are useful in the form of the free base or acid or in the form of a pharmaceutically acceptable salt thereof. All forms are  
25   within the scope of the invention.

The term "therapeutically effective amount" means the total amount of each active component that is sufficient to show a meaningful patient benefit, e.g., a sustained reduction in viral load. When applied to an individual active ingredient,  
30   administered alone, the term refers to that ingredient alone. When applied to a combination, the term refers to combined amounts of the active ingredients that result

in the therapeutic effect, whether administered in combination, serially or simultaneously.

The term "compounds of the invention", and equivalent expressions, are  
5 meant to embrace compounds of formula I, and pharmaceutically acceptable enantiomers, diastereomers, salts, and solvates, e.g. hydrates, and prodrugs. Similarly, references to intermediates, are meant to embrace their salts, and solvates, where the context so permits. References to the compound of the invention also include the preferred compounds, e.g. formula II and formula III.

10

The term "derivative" means a chemically modified compound wherein the modification is considered routine by the ordinary skilled chemist, such as an ester or an amide of an acid, protecting groups, such as a benzyl group for an alcohol or thiol, and tert-butoxycarbonyl group for an amine.

15

The term "solvate" means a physical association of a compound of this invention with one or more solvent molecules, whether organic or inorganic. This physical association includes hydrogen bonding. In certain instances the solvate will be capable of isolation, for example when one or more solvent molecules are  
20 incorporated in the crystal lattice of the crystalline solid. "Solvate" encompasses both solution-phase and isolable solvates. Exemplary solvates include hydrates, ethanulates, methanulates, isopropanulates and the like.

The term "prodrug" as used herein means derivatives of the compounds of the  
25 invention which have chemically or metabolically cleavable groups and become, by solvolysis or under physiological conditions, the compounds of the invention which are pharmaceutically active in vivo. A prodrug of a compound may be formed in a conventional manner with a functional group of the compounds such as with an amino, hydroxy or carboxy group when present. The prodrug derivative form often  
30 offers advantages of solubility, tissue compatibility, or delayed release in a mammalian organism (see, Bundgard, H., Design of Prodrugs, pp. 7-9, 21-24, Elsevier, Amsterdam 1985). Prodrugs include acid derivatives well known to

practitioners of the art, such as, for example, esters prepared by reaction of the parent acidic compound with a suitable alcohol, or amides prepared by reaction of the parent acid compound with a suitable amine.

5           The term "patient" includes both human and other mammals.

          The term "pharmaceutical composition" means a composition comprising a compound of the invention in combination with at least one additional pharmaceutical carrier, i.e., adjuvant, excipient or vehicle, such as diluents,  
10   preserving agents, fillers, flow regulating agents, disintegrating agents, wetting agents, emulsifying agents, suspending agents, sweetening agents, flavoring agents, perfuming agents, antibacterial agents, antifungal agents, lubricating agents and dispensing agents, depending on the nature of the mode of administration and dosage forms. Ingredients listed in Remington's Pharmaceutical Sciences, 18<sup>th</sup> ed., Mack  
15   Publishing Company, Easton, PA (1999) for example, may be used.

          The phrase "pharmaceutically acceptable" is employed herein to refer to those compounds, materials, compositions, and/or dosage forms which are, within the scope of sound medical judgment, suitable for use in contact with the tissues of  
20   patients without excessive toxicity, irritation, allergic response, or other problem or complication commensurate with a reasonable risk/benefit ratio.

          The term "treating" refers to: (i) preventing a disease, disorder or condition from occurring in a patient which may be predisposed to the disease, disorder and/or  
25   condition but has not yet been diagnosed as having it; (ii) inhibiting the disease, disorder or condition, i.e., arresting its development; and (iii) relieving the disease, disorder or condition, i.e., causing regression of the disease, disorder and/or condition.

30           The term "substituted" as used herein includes substitution at from one to the maximum number of possible binding sites on the core, e.p., organic radical, to

which the substituent is bonded, e.g., mono-, di-, tri- or tetra- substituted, unless otherwise specifically stated.

The nomenclature used to describe organic radicals, e.g., hydrocarbons and substituted hydrocarbons, generally follows standard nomenclature known in the art, unless otherwise specifically defined. Combinations of groups, e.g., alkylalkoxyamine or arylalkyl, include all possible stable configurations, unless otherwise specifically stated. Certain radicals and combinations are defined below for purposes of illustration.

10

The term "halo" as used herein means a halogen substituent selected from bromo, chloro, fluoro or iodo. The term "haloalkyl" means an alkyl group that is substituted with one or more halo substituents.

15

The term "alkyl" as used herein means acyclic, straight or branched chain alkyl substituents having the specified number of carbon atoms and includes, for example, methyl, ethyl, propyl, butyl, tert-butyl, hexyl, 1-methylethyl, 1-methylpropyl, 2-methylpropyl, 1,1-dimethylethyl. Thus, C<sub>1-6</sub> alkyl refers to an alkyl group having from one to six carbon atoms. The term "lower alkyl" means an alkyl group having from one to six, preferably from one to four carbon atoms. The term "alkylester" means an alkyl group additionally containing an ester group. Generally, a stated carbon number range, e.g., C<sub>2-6</sub> alkylester, includes all of the carbon atoms in the radical.

20

The term "alkenyl" as used herein means an alkyl radical containing at least one double bond, e.g., ethenyl (vinyl) and alkyl.

25

The term "alkoxy" as used herein means an alkyl group with the indicated number of carbon atoms attached to an oxygen atom. Alkoxy includes, for example, methoxy, ethoxy, propoxy, 1-methylethoxy, butoxy and 1,1-dimethylethoxy. The latter radical is referred to in the art as tert-butoxy. The term "alkoxycarbonyl" means an alkoxy group additionally containing a carbonyl group.

30

The term "cycloalkyl" as used herein means a cycloalkyl substituent containing the indicated number of carbon atoms and includes, for example, cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, cycloheptyl and spiro cyclic groups  
5 such as spirocyclopropyl as spirocyclobutyl. The term "cycloalkoxy" as used herein means a cycloalkyl group linked to an oxygen atom, such as, for example, cyclobutyloxy or cyclopropyloxy. The term "alkylcycloalkyl" means a cycloalkyl group linked to an alkyl group. The stated carbon number range includes the total number of carbons in the radical, unless otherwise specifically stated. This a C<sub>4-10</sub>  
10 alkylcycloalkyl may contain from 1-7 carbon atoms in the alkyl group and from 3-9 carbon atoms in the ring, e.g., cyclopropylmethyl or cyclohexylethyl.

The term "aryl" as used herein means an aromatic moiety containing the indicated number of carbon atoms, such as, but not limited to phenyl, indanyl or  
15 naphthyl. For example, C<sub>6-10</sub> aryl refers to an aromatic moiety having from six to ten carbon atoms which may be in the form of a monocyclic or bicyclic structure. The term "haloaryl" as used herein refers to an aryl mono, di or tri substituted with one or more halogen atoms. The terms "alkylaryl", "arylalkyl" and "aralalkyl" mean an aryl group substituted with one or more alkyl groups. Unless the carbon range of each  
20 group is specified, the stated range applies to the entire substituent. Thus, a C<sub>7-14</sub> alkylaryl group may have from 1-8 carbon atoms in the alkyl group for a monocyclic aromatic and from 1-4 carbon atoms in the alkyl group for a fused aromatic. Similarly, a C<sub>1-6</sub> alkyl-aryl group would contain a six membered aryl group and a 1-6 carbon alkyl segment. A C<sub>1-6</sub> alkyl-diaryl group would contain a ten  
25 membered aryl group and a 1-6 carbon alkyl segment. The attachment of the group to bonding site on the molecule can be either at the aryl group or the alkyl group. Unless a specific aryl radical is specified, e.g., fluoro-phenyl, or the radical is stated to be unsubstituted, the aryl radicals include those substituted with typical substituents known to those skilled in the art, e.g., halogen, hydroxy, carboxy,  
30 carbonyl, nitro, sulfo, amino, cyano, dialkylamino haloalkyl, CF<sub>3</sub>, haloalkoxy, thioalkyl, alkanoyl, SH, alkylamino, alkylamide, dialkylamide, carboxyester,

alkylsulfone, alkylsulfonamide and alkyl(alkoxy)amine. Examples of alkylaryl groups include benzyl, butylphenyl and 1-naphthylmethyl.

The term "alkanoyl" as used herein means straight or branched 1-oxoalkyl radicals containing the indicated number of carbon atoms and includes, for example, 5 formyl, acetyl, 1-oxopropyl (propionyl), 2-methyl-1-oxopropyl, 1-oxohexyl and the like.

The term "alkylamide" as used herein means an amide mono-substituted with 10 an alkyl, such as

15 The term "heterocycle", also referred to as "Het", as used herein means 7-12 membered bicyclic heterocycles and 5-9 membered monocyclic heterocycles.

Preferred bicyclic heterocycles are 7-12 membered fused bicyclic ring systems (both rings share an adjacent pair of atoms) containing from one to four 20 heteroatoms selected from nitrogen, oxygen and sulfur, wherein one or both rings of the heterocycle can be saturated, partially saturated or fully unsaturated ring system (this latter subset also herein referred to as unsaturated heteroaromatic or heteroaryl). The nitrogen and sulfur heteroatoms atoms may be optionally oxidized. The bicyclic heterocycle may contain the heteroatoms in one or both rings. Unless a specific 25 heterocycle is specified, e.g., a fluorinated 7-12 membered bicyclic heterocycle, or the heterocycle is stated to be unsubstituted, the heterocycles include those substituted with typical substituents known to those skilled in the art. For example, the bicyclic heterocycle may also contain substituents on any of the ring carbon atoms, e.g., one to three substituents. Examples of suitable substituents include C<sub>1-6</sub> 30 alkyl, C<sub>3-7</sub> cycloalkyl, C<sub>1-6</sub> alkoxy, C<sub>3-7</sub> cycloalkoxy, halo-C<sub>1-6</sub> alkyl, CF<sub>3</sub>, mono- or di-

When two substituents are attached to vicinal carbon atoms of the bicyclic heterocycle, they can join to form a ring, e.g., a five, six or seven membered ring system containing up to two heteroatoms selecting from oxygen and nitrogen.

Examples of bicyclic heterocycles include, but are not limited to, the following ring systems:

Preferred monocyclic heterocycles are 5-9 membered saturated, partially saturated or fully unsaturated ring system (this latter subset also herein referred to as unsaturated heteroaromatic) containing in the ring from one to four heteroatoms selected from nitrogen, oxygen and sulfur, wherein the sulfur and nitrogen heteroatoms may be optionally oxidized. Unless a specific heterocycle is specified, e.g., a C<sub>1-6</sub> alkoxy substituted 5-7 membered monocyclic heterocycle, or the heterocycle is stated to be unsubstituted, the heterocycles include those substituted with typical substituents known to those skilled in the art. For example, the monocyclic heterocycle may also contain substituents on any of the ring atoms, e.g., one to three substituents.           The enantiomers may be resolved by methods known to those skilled in the art, for example, by formation of diastereoisomeric salts which may be separated by  
10   crystallization, gas-liquid or liquid chromatography, selective reaction of one enantiomer with an enantiomer-specific reagent. It will be appreciated that where the desired enantiomer is converted into another chemical entity by a separation technique, then an additional step is required to form the desired enantiomeric form. Alternatively, specific enantiomers may be synthesized by asymmetric synthesis  
15   using optically active reagents, substrates, catalysts or solvents, or by converting one enantiomer into the other by asymmetric transformation.

          The compounds of the present invention may be in the form of a prodrug. Simple aliphatic or aromatic esters derived from, when present, acidic groups  
20   pendent on the compounds of this invention are preferred prodrugs. In some cases it is desirable to prepare double ester type prodrugs such as (acyloxy) alkyl esters or (alkoxycarbonyl)oxy)alkyl esters.

          Certain compounds of the present invention may also exist in different stable  
25   conformational forms which may be separable. Torsional asymmetry due to restricted rotation about an asymmetric single bond, for example because of steric hindrance or ring strain, may permit separation of different conformers. The present invention includes each conformational isomer of these compounds and mixtures thereof.

Certain compounds of the present invention may exist in zwitterionic form and the present invention includes each zwitterionic form of these compounds and mixtures thereof.

5           The starting materials useful to synthesize the compounds of the present invention are known to those skilled in the art and can be readily manufactured or are commercially available.

          The compounds of the present invention can be manufactured by methods  
10   known to those skilled in the art, see e.g., (Sunderland, J. S.; Botta, M.; Aime, S.; Raymond, K. N. Inorg. Chem. (2001), 40, 6756-6756). The following methods set forth below are provided for illustrative purposes and are not intended to limit the scope of the claimed invention. It will be recognized that it may be preferred or  
15   necessary to prepare such a compound in which a functional group is protected using a conventional protecting group then to remove the protecting group to provide a compound of the present invention. The details concerning the use of protecting groups in accordance with the present invention are known to those skilled in the art.

          The compounds of the present invention can be synthesized according to  
20   Scheme I. In Scheme I, an oxalic acid diester 1-1 is condensed with glycolate 1-2 using sodium hydride or a similar base. The intermediate generated from this reaction can be isolated but more often is reacted in one pot with an appropriately substituted amidine (1-3) to yield the pyrimidinone heterocycle 1-4. This is alkylated with a suitable electrophile, 1-5, under basic conditions. From here there are two  
25   alternative pathways to the final product. In one path intermediate 1-6 is treated with base to saponify the ester and the resulting acid coupled with amine 1-7. It will be appreciated by those skilled in the art that the amide coupling reaction can be carried out under a variety of conditions such as those disclosed in Jerry March, Advanced Organic Chemistry, 3<sup>rd</sup> edition, John Wiley & Sons, 1985. The resulting amide, 1-8  
30   is then treated under conditions appropriate for cleaving the protecting group R<sub>b</sub> to yield 1-10. Where R<sub>b</sub> is alkyl, this can be accomplished by BBr<sub>3</sub> or other conditions familiar to those skilled in the art, such as treatment with LiI. Alternatively when R<sub>b</sub>

is a benzylic or substituted benzylic group the ether can be cleaved under reductive conditions, oxidative conditions or acidic conditions. Protecting groups, R, useful for the synthesis of compounds such as 1-9 can be found in Greene, T. W. and Wutz, P. G. M. *Protective Groups in Organic Synthesis*, Second Edition, 1991, John Wiley and Sons, New York. In the alternative pathway, the protecting group is removed from 1-6 to yield 1-9. At elevated temperatures 1-9 reacts with amines to afford 1-10.

Scheme I

In Scheme II, an alternative pathway is shown in which the  $R^5$  group is introduced at a later stage of the synthesis. Thus, 2-2 is formed from an oxalate ester, protected glycolic acid and S-methyl-thiourea using the same conditions as described in Scheme I. Likewise, this intermediate is carried through the same sequence of reactions described in Scheme I to yield 2-4. The thiomethyl group is then displaced with a nitrogen containing heterocycle, such as those shown in the scheme, under acidic conditions (HCl) similar to those described in Ple, N.; Turck, Heynderick, A.; Queguiner, G. J. *Heterocycl. Chem.* (1997) 34, 551-556, for example, or after oxidation of the sulphur atom as described in Jacobs, R. T.; Mauger, R. C.; Ulatowski, T. G.; Aharony, D.; Buckner, C. K. *Bioorg. Med. Chem. Lett.* (1995), 23, 2879-2884. Following the installation of the amine at C2 of the pyrimidine template

there are two alternative pathways for introducing the amide group. These are essentially the same as those described in Scheme I

Scheme II

5

A different route to intermediate 2-3 is shown in scheme III.

Methylthiocyanate reacts with appropriately substituted amines to form N-hydroxyl amidines such as 3-2. This intermediate will react with an alkyne-diester to afford a mixture of 3-4 and 3-5. Both of these compounds will rearrange to form the hydroxypyrimidinone template (Culbertson, T. P.; J. Heterocyclic Chem. (1979) 16, 1423-1424.). The in-situ reaction with an appropriate electrophile results in 2-3.

Scheme III

- 5           The compounds of the present invention can, for example, be preferably synthesized according to Scheme I. In Scheme I, an oxalic acid diester 1-1 is condensed with glycolate 1-2 using sodium hydride or a similar base. The intermediate generated from this reaction can be isolated but more often is reacted in one pot with an appropriately substituted amidine (1-3) to yield the pyrimidinone heterocycle 1-4. This is alkylated with a suitable electrophile, 1-5, under basic conditions. Intermediate 1-6 is treated with base to saponify the ester and the resulting acid coupled with amine 1-7. It will be appreciated by those skilled in the art that the amide coupling reaction can be carried out under a variety of conditions such as those disclosed in Jerry March, *Advanced Organic Chemistry*, 3<sup>rd</sup> edition, John Wiley & Sons, 1985. The resulting amide, 1-8 is then treated under conditions appropriate for cleaving the protecting group R. For alkyl groups, where R is alkyl, this can be accomplished by BBr<sub>3</sub> or other conditions familiar to those skilled in the art, such as treatment with LiI. Alternatively when R is a benzylic or substituted benzylic group the ether can be cleaved under reductive conditions, oxidative conditions or acidic conditions. Protecting groups, R, useful for the synthesis of compounds such as 1-9 can be found in Greene, T. W. and Wutz, P. G. M. *Protective Groups in Organic Synthesis*, Second Edition, 1991, John Wiley and Sons, New York.

A preferred intermediate for use in accordance with the present invention is a compound of the formula:

5

R<sup>15</sup> is -H, -C<sub>1-6</sub> alkyl, C<sub>1-6</sub> alkyl-cycloalkyl, -aryl, or -C<sub>1-6</sub> alkyl-aryl, and

R<sup>16</sup> is -H, -C<sub>1-6</sub> alkyl, C<sub>1-6</sub> cycloalkyl, -aryl, C<sub>1-6</sub> alkyl-aryl, or -C<sub>1-6</sub> alkyl-diaryl.

20

The present invention also provides compositions comprising a compound of the present invention, or a pharmaceutically acceptable enantiomer, diastereomer, salt, solvate or prodrug thereof, and a pharmaceutically acceptable carrier.

25 Pharmaceutical compositions of the present invention comprise a therapeutically effective amount of a compound of the invention, or a pharmaceutically acceptable enantiomer, diastereomer, salt, solvate or prodrug thereof, and a pharmaceutically acceptable carrier, with a pharmaceutically acceptable carrier, e.g., excipient, or vehicle diluent.

30

The active ingredient, i.e., compound, in such compositions typically comprises from 0.1 weight percent to 99.9 percent by weight of the composition, and often comprises from about 5 to 95 weight percent.

5        Thus, in one aspect of the invention, there is provided a composition comprising the compound of formula 1 and a pharmaceutically acceptable carrier. Preferably, the composition further comprises a compound having anti-HIV activity. As used herein, the term "anti-HIV activity" means the compound is effective to inhibit the function of a target selected from the group consisting of HIV protease, a  
10        nucleoside reverse transcriptase, a non-nucleoside reverse transcriptase or HIV entry. Often, the other compound having anti-HIV activity is effective to inhibit the function of target in the HIV life cycle other than HIV integrase.

      In a preferred aspect of the invention, the compound having anti-HIV activity  
15        is a small molecule compound. As used herein, the term "small molecule compound" means a compound having a molecular weight of less than 1,500 daltons, preferably less than 1000 daltons. Preferably, the small molecule compound is effective to inhibit the function of a target selected from the group consisting of HIV protease, a nucleoside reverse transcriptase, a non-nucleoside reverse transcriptase or HIV entry.

20

      Preferred compounds having anti-HIV activity include those selected from the group consisting of HIV protease inhibitors, nucleoside reverse transcriptase inhibitors, non-nucleoside reverse transcriptase inhibitors, HIV-entry inhibitors, immunomodulators, antiinfectives, and vaccines.

25

      Thus the present invention is also directed to combinations of the compounds with one or more agents useful in the treatment of AIDS. For example, the compounds of this invention may be effectively administered, whether at periods of pre-exposure and/or post-exposure, in combination with effective amounts of the  
30        AIDS antivirals, immunomodulators, antiinfectives, or vaccines, such as those in the following table.

Additionally, the compounds of the invention herein may be used in  
 35 combination with another class of agents for treating AIDS which are called HIV  
 entry inhibitors. Examples of such HIV entry inhibitors are discussed in DRUGS OF  
 THE FUTURE 1999, 24(12), pp. 1355-1362; CELL, Vol. 9, pp. 243-246, Oct. 29,  
 1999; and DRUG DISCOVERY TODAY, Vol. 5, No. 5, May 2000, pp. 183-194.

It will be understood that the scope of combinations of the compounds of this invention with AIDS antivirals, immunomodulators, anti-infectives, HIV entry inhibitors or vaccines is not limited to the list in the above Table 1, but includes in principle any combination with any pharmaceutical composition useful for the treatment of AIDS.

Preferred combinations are simultaneous or alternating treatments of with a compound of the present invention and an inhibitor of HIV protease and/or a non-nucleoside inhibitor of HIV reverse transcriptase. An optional fourth component in the combination is a nucleoside inhibitor of HIV reverse transcriptase, such as AZT, 3TC, ddC or ddI. A preferred inhibitor of HIV protease is indinavir, which is the sulfate salt of N-(2(R)-hydroxy-1-(S)-indanyl)-2(R)-phenylmethyl-4-(S)-hydroxy-5-(1-(4-(3-pyridyl-methyl)-2(S)-N'-(t-butylcarboxamido)-piperazinyl))-pentaneamide ethanolate, and is synthesized according to U.S. 5,413,999. Indinavir is generally administered at a dosage of 800 mg three times a day. Other preferred protease inhibitors are nelfinavir and ritonavir. Another preferred inhibitor of HIV protease is saquinavir which is administered in a dosage of 600 or 1200 mg tid. Preferred non-nucleoside inhibitors of HIV reverse transcriptase include efavirenz. The preparation of ddC, ddI and AZT are also described in EPO 0,484,071. These combinations may have unexpected effects on limiting the spread and degree of infection of HIV. Preferred combinations include those with the following (1) indinavir with efavirenz, and, optionally, AZT and/or 3TC and/or ddI and/or ddC; (2) indinavir, and any of AZT and/or ddI and/or ddC and/or 3TC, in particular, indinavir and AZT and 3TC; (3) stavudine and 3TC and/or zidovudine; (4) zidovudine and lamivudine and 141W94 and 1592U89; (5) zidovudine and lamivudine.

The pharmaceutical compositions of this invention may be administered orally, parenterally or via an implanted reservoir. Oral administration or administration by injection are preferred. In some cases, the pH of the formulation may be adjusted with pharmaceutically acceptable acids, bases or buffers to enhance the stability of the formulated compound or its delivery form. The term parenteral as

used herein includes subcutaneous, intracutaneous, intravenous, intramuscular, intra-articular, intrasynovial, intrasternal, intrathecal, and intralesional injection or infusion techniques.

5           When orally administered, the pharmaceutical compositions of this invention may be administered in any orally acceptable dosage form including, but not limited to, capsules, tablets, and aqueous suspensions and solutions. In the case of tablets for oral use, carriers which are commonly used include lactose and corn starch. Lubricating agents, such as magnesium stearate, are also typically added. For oral  
10 administration in a capsule form, useful diluents include lactose and dried corn starch. When aqueous suspensions are administered orally, the active ingredient is combined with emulsifying and suspending agents. If desired, certain sweetening and/or flavoring and/or coloring agents may be added. Other suitable carriers for the above noted compositions can be found in standard pharmaceutical texts, e.g. in  
15 "Remington's Pharmaceutical Sciences", 19th ed., Mack Publishing Company, Easton, Penn., 1995.

          The pharmaceutical compositions can be prepared by known procedures using well-known and readily available ingredients. The compositions of this invention  
20 may be formulated so as to provide quick, sustained or delayed release of the active ingredient after administration to the patient by employing procedures well known in the art. In making the compositions of the present invention, the active ingredient will usually be admixed with a carrier, or diluted by a carrier, or enclosed within a carrier which may be in the form of a capsule, sachet, paper or other container.  
25 When the carrier serves as a diluent, it may be a solid, semi-solid or liquid material which acts as a vehicle, excipient or medium for the active ingredient. Thus, the compositions can be in the form of tablets, pills, powders, beadlets, lozenges, sachets, elixirs, suspensions, emulsions, solutions, syrups, aerosols, (as a solid or in a liquid medium), soft and hard gelatin capsules, suppositories, sterile injectable solutions,  
30 sterile packaged powders and the like. Further details concerning the design and preparation of suitable delivery forms of the pharmaceutical compositions of the invention are known to those skilled in the art.

Dosage levels of between about 0.01 and about 1000 milligram per kilogram ("mg/kg") body weight per day, preferably between about 0.5 and about 250 mg/kg body weight per day of the compounds of the invention are typical in a monotherapy  
5 for the prevention and treatment of HIV mediated disease. Typically, the pharmaceutical compositions of this invention will be administered from about 1 to about 5 times per day or alternatively, as a continuous infusion. Such administration can be used as a chronic or acute therapy. The amount of active ingredient that may be combined with the carrier materials to produce a single dosage form will vary  
10 depending upon the host treated and the particular mode of administration.

As the skilled artisan will appreciate, lower or higher doses than those recited above may be required. Specific dosage and treatment regimens for any particular patient will depend upon a variety of factors, including the activity of the specific  
15 compound employed, the age, body weight, general health status, sex, diet, time of administration, rate of excretion, drug combination, the severity and course of the infection, the patient's disposition to the infection and the judgment of the treating physician. Generally, treatment is initiated with small dosages substantially less than the optimum dose of the peptide. Thereafter, the dosage is increased by small  
20 increments until the optimum effect under the circumstances is reached. In general, the compound is most desirably administered at a concentration level that will generally afford antivirally effective results without causing any harmful or deleterious side effects.

25 When the compositions of this invention comprise a combination of a compound of the invention and one or more additional therapeutic or prophylactic agent, both the compound and the additional agent are usually present at dosage levels of between about 10 to 100%, and more preferably between about 10 and 80% of the dosage normally administered in a monotherapy regimen.

30

When these compounds or their pharmaceutically acceptable enantiomers, diastereomers, salts, solvates or prodrugs are formulated together with a

pharmaceutically acceptable carrier, the resulting composition may be administered in vivo to mammals, such as man, to inhibit HIV integrase or to treat or prevent HIV virus infection.

5           Accordingly, another aspect of this invention provides methods of inhibiting HIV integrase activity in patients by administering a compound of the present invention or a pharmaceutically acceptable enantiomer, diastereomer, salt or solvate thereof.

10           In one aspect of the invention, there is provided a method of treating an HIV infection in a patient, comprising administering to the patient a therapeutically effective amount of the compound of the invention, or a pharmaceutically acceptable enantiomer, diastereomer, solvate, prodrug or salt thereof.

15           Preferably, the method of administering the compound is effective to inhibit the function of the HIV integrase. In a preferred aspect, the method further comprises administering another compound having anti-HIV activity (as described above) prior to, after or concurrently with a compound of the invention.

20           The compounds of the invention may also be used as laboratory reagents. Compounds may be instrumental in providing research tools for designing of viral replication assays, validation of animal assay systems and structural biology studies to further enhance knowledge of the HIV disease mechanisms. Further, the compounds of the present invention are useful in establishing or determining the  
25           binding site of other antiviral compounds, for example, by competitive inhibition.

          The compounds of this invention may also be used to treat or prevent viral contamination of materials and therefore reduce the risk of viral infection of laboratory or medical personnel or patients who come in contact with such materials,  
30           e.g., blood, tissue, surgical instruments and garments, laboratory instruments and garments, and blood collection or transfusion apparatuses and materials.

Further, the compounds and compositions of the invention can be used for the manufacture of a medicament for treating HIV infection in a patient.

### EXAMPLES

The specific examples that follow illustrate the syntheses of the compounds of the instant invention, and are not to be construed as limiting the invention in sphere or scope. The methods may be adapted to variations in order to produce compounds embraced by this invention but not specifically disclosed. Further, variations of the methods to produce the same compounds in somewhat different manner will also be evident to one skilled in the art.

In the following experimental procedures, all temperatures are understood to be in Centigrade (C) when not specified. The nuclear magnetic resonance (NMR) spectral characteristics refer to chemical shifts ( $\delta$ ) expressed in parts per million (ppm) versus tetramethylsilane (TMS) as reference standard. The relative area reported for the various shifts in the proton NMR spectral data corresponds to the number of hydrogen atoms of a particular functional type in the molecule. The nature of the shifts as to multiplicity is reported as broad singlet (bs or br s), broad doublet (bd or br d), broad triplet (bt or br t), broad quartet (bq or br q), singlet (s), multiplet (m), doublet (d), quartet (q), triplet (t), doublet of doublet (dd), doublet of triplet (dt), and doublet of quartet (dq). The solvents employed for taking NMR spectra are acetone- $d_6$  (deuterated acetone), DMSO- $d_6$  (perdeuterodimethylsulfoxide),  $D_2O$  (deuterated water),  $CDCl_3$  (deuteriochloroform) and other conventional deuterated solvents.

The abbreviations used herein are conventional abbreviations widely employed in the art. Some of which are: calcd (calculated); DMSO (dimethylsulfoxide); EtOAc (ethyl acetate); HPLC (high-pressure liquid chromatography); LC/MS (liquid chromatography, mass spectroscopy); LDA (lithium diisopropyl amide); LiHMDS (lithium bis(trimethylsilyl)amide);  $SiO_2$  (silica gel); THF (tetrahydrofuran), TFA (trifluoroacetic acid), Me (methyl), Et (ethyl), Ph (phenyl), tBuOK (potassium tert-

butoxide), NaOMe (sodium methoxide), NaOEt (sodium ethoxide), Boc (tert-butoxycarbonyl), and DEAD (diethylazo dicarboxylate).

A solution of diethyl oxalate (27.2 g, 0.186 mol) and methyl methoxyacetate  
15 (19.38 g, 0.186 mol) in dry tetrahydrofuran (250 ml) was treated at 22 °C with  
sodium hydride (8.15 g of a 60 % dispersion in mineral oil, 0.203 mol) and the  
resulting mixture was stirred at 22 °C for 18h. The tetrahydrofuran was then  
evaporated under reduced pressure and the residual orange syrup was dissolved in a  
solution of sodium ethoxide (0.189 mol, prepared from 4.35 g of sodium) in ethanol

ethanol was evaporated under reduced pressure. The residual paste was partitioned  
between water and dichloromethane and the aqueous phase was extracted five times

Method 2: To a stirred solution of methylthiocyanate (91 g, 1.245 Moles) and N-methylhydroxylamine hydrochloride (100 g, 1.197 Moles) in 1:1 ethanol/water (v/v, 500 mL) was carefully added Na<sub>2</sub>CO<sub>3</sub> (63.6 g, 0.6 Moles) over 30 min at room temperature. The resulting reaction mixture was stirred 48 h then cooled in an ice-water bath. To this was slowly added diethyl acetylenedicarboxylate (192 mL, 1.2 Moles) over 10 minutes. After stirring 2 h, the resulting dark-brown reaction mixture was transferred to a separatory funnel and extracted with ethyl acetate (3 X 250 mL). A solution of the above crude intermediate in xylenes (1.2 L) was placed in a pre-heated oil bath (140 °C) and stirred for 48 h. The mixture was then cooled and concentrated to give a dark solid. This crude product mixture was dissolved into

anhydrous DMF (1.5 L) to which was added benzyl bromide (119 mL, 1 Mole) followed by  $K_2CO_3$  (138 g, 1 Mole). The organic layer was dried ( $Na_2SO_4$ /activated charcoal), filtered and concentrated to afford dark paste which was dissolved in ether/hexanes (2:1, 1.5 L). Approximately 1L of the solvent was removed on a rotary evaporator. The resulting solution was left overnight at room temperature and the brown-crystals which formed were removed by filtration. The filtrate was concentrated then chromatographed (EM Science silica gel 60, column size  $\sim 30 \times 10 \text{ cm}^2$ ) using 8:1:1 Hexanes/ETOAc/ $CH_2Cl_2$  solvent system and collected into 250 mL fractions. The fractions containing the desired compound were combined and concentrated to give a viscous oil which was dissolved into Hex/ $Et_2O$  ( $\sim 4:1$ ) and allowed to crystallize (92.3 g). An additional 8.84 grams of product was isolated after the mother liquor was concentrated and allowed to sit for 48h Resulting in a total yield 101.14 g (25.3% yield).

### BIOLOGICAL ACTIVITY

#### HIV-Integrase Inhibition Activity

- 15 To evaluate *in-vitro* activity against HIV-integrase, 5 pmole of biotin labeled substrate DNA was bound to 100  $\mu$ g of Streptavidin coated PVT SPA beads (Amersham Pharmacia Biotech). Recombinant integrase (0.26 ng) was incubated with the beads for 90 min at 37 °C. Unbound enzyme was removed by washing the complex followed by addition of inhibitors and 0.1 fmol of P33 labeled target DNA.
- 20 The reaction was stopped by adding EDTA to a final concentration of 10 mM. Samples were counted in TopCountNXT (Packard) and the CPM was used as a measure of integration. The reaction condition was as described in A. Engelman and R. Craigie, J. Virol. 69, 5908-5911 (1995). The sequences of substrate and target DNA were described in Nucleic Acid Research 22, 1121-1122 (1994). Results are
- 25 shown in the table. Activity equal to A refers to a compound having  $IC_{50} = 0.003$  to

0.10  $\mu\text{M}$  while B and C denote compounds the following  $\text{IC}_{50} = 0.1$  to  $1.0 \mu\text{M}$  and  $\text{IC}_{50} \geq 1.0 \mu\text{M}$  respectively.

#### Inhibition of HIV replication

A recombinant NL-Rluc virus was constructed in which a section of the nef gene from NL4-3 was replaced with the *Renilla* Luciferase gene. The NL-RLuc virus was prepared by co-transfection of two plasmids, pNLRLuc and pVSVenv. The pNLRLuc contains the NL-Rluc DNA cloned into pUC18 at the *Pvu*II site, while the pVSVenv contains the gene for VSV G protein linked to an LTR promoter. Transfections were performed at a 1:3 ratio of pNLRLuc to pVSVenv on 293T cells using the LipofectAMINE PLUS kit from Invitrogen (Carlsbad, CA) according to manufactures instruction, and the pseudotype virus generated was titered in MT-2 cells.

Susceptibility of viruses to compounds was determined by incubation in the presence of serial dilutions of the compound. The 50% effective concentration (EC<sub>50</sub>) was calculated by using the exponential form of the median effect equation where  $(Fa) = 1/[1 + (ED_{50}/\text{drug conc.})^m]$  (Johnson VA, Byington RT. Infectivity Assay. In *Techniques in HIV Research*. ed. Aldovini A, Walker BD. 71-76. New York: Stockton Press.1990). The anti-viral activity of compounds was evaluated under three serum conditions, 10% FBS, 15mg/ml human serum albumin/10% FBS or 40% human serum/5% FBS, and the results from at least 2 experiments were used to calculate the EC<sub>50</sub> values. Results are shown in the table. Activity equal to A

refers to a compound having  $EC_{50} = 0.003$  to  $0.10 \mu\text{M}$  while B and C denote compounds the following  $EC_{50} = 0.1$  to  $1.0 \mu\text{M}$  and  $EC_{50} \geq 1.0 \mu\text{M}$  respectively.
